The current communication technology is still in its infancy. It has a long way to go to reach the efficient stage of being an interplanetary relay station. It must improve its subtlety and put no more restrictive barriers on the grounds that only the Earth would be inhabited. As we have already said, its level of evolution is at an early stage.

"Men have a high opinion of themselves. Scientists believe they are the only ones to possess the truth, whereas they still are at the level of kindergarten—no more, no less. The planets that they assume not to be inhabited have forms of life far different from their own, and the few lights from which they benefit from, come from a beyond they cannot even imagine. Will it finally be necessary for a large number of those beings to come to Earth during trying and hopeless times for the inhabitants, and get them out of a tragic situation, so that in the end they became aware of their limitations? They will then have to align themselves with advanced knowledge and to reconsider all that they thought they had acquired.

"They will have to start all over again on sound bases, enlightened by this highly developed race which, in spite of that, won't easily impose their views. Absolute necessity will have the force of law. Men, for their survival, will have to abide by it."
